

Datasets:

Downloaded the binary image files for this homework from [https:// www.cs.toronto.edu/~kriz/cifar.html](https://www.cs.toronto.edu/~kriz/cifar.html).

The CIFAR-10 dataset consists of 60000 32x32 colour images in 10 classes, with 6000 images per class. There are 50000 training images and 10000 test images.

The dataset is divided into five training batches and one test batch, each with 10000 images. The test batch contains exactly 1000 randomly-selected images from each class. The training batches contain the remaining images in random order, but some training batches may contain more images from one class than another. Between them, the training batches contain exactly 5000 images from each class.

Plot:

The plot between Part-2 and Part-3 look very similar in terms of how the categories are clustered for most of the images categories and the similarity between them. The low dimensional image reconstruction using the 20 PCs from the same category and the reconstruction using the 20 PCs of other categories in Part 3 have small difference in variance (per pixel difference averaged over all image categories) and that is an interesting fact probably because the first 20 PCs contribute significantly to variance in all image categories & their cumulative variances are similar. The first 20 PCs have drastic impact on change in quality but as more PCs are added there is a sequential improvement in quality.
